FIRE EFFECT

Djegia e Question Sticker

Ndez sticker-in me çakmak dhe lëre të digjet realisht, pa ndryshuar pozicion.

PROMPT / ENGLISH

Use the provided image as the exact visual reference and first frame. Preserve the original composition, framing, subject identity, environment, and positions of all elements.

CRITICAL POSITION LOCK: The question sticker must remain EXACTLY where it appears in the original reference image, at the same screen coordinates, with the same size, orientation, and distance from the subject. Never move, lower, enlarge, reposition, or center the sticker. It must NEVER shift in front of the subject's face or body.

The camera remains completely stationary throughout the entire video. No zoom, no reframing, no cuts.

The person naturally picks up a small cigarette lighter, ignites it with their thumb, and extends their arm toward the ORIGINAL POSITION of the question sticker. The person's hand must physically reach the sticker, NOT the other way around.

The lighter produces a small, realistic yellow-orange flame. When the flame makes direct contact with the bottom edge of the sticker, the material begins to burn precisely at that contact point.

First, a tiny dark scorch mark appears. The material gradually browns, blackens, and curls inward from the heat. A small flame develops and progressively spreads upward and sideways across the sticker.

The burning must follow realistic combustion physics: irregular flame movement, glowing edges, progressive charring, curling material, thin rising smoke, and small floating embers.

The text and question input field burn away together with the sticker, gradually disappearing as the flames consume the material. The remaining burnt edges crumble into tiny ash particles.

Realistic orange firelight subtly illuminates the person's hand and nearby surfaces.

The person naturally lowers the lighter after igniting the sticker. The sticker continues burning in its ORIGINAL FIXED POSITION until it completely disappears, revealing the unchanged background behind it.

Maintain exact facial identity, natural anatomy, original clothing, realistic hand movement, consistent lighting, and perfect spatial continuity.

IMPORTANT: All visual elements must stay locked to their original positions. ONLY the person's body and hand may move naturally. The sticker must remain completely stationary until destroyed by the fire.

Ultra-photorealistic live-action footage. Authentic lighter ignition, realistic fire simulation, natural smoke dynamics, seamless visual effects.

NO sticker movement, NO repositioning, NO sticker covering the face, NO floating toward the camera, NO scaling, NO camera movement, NO sudden disappearance, NO explosions, NO cartoon fire, NO distorted hands, NO additional objects.

PROMPT 02 / 03

PAPER CRUMPLE

Notification në top letre

Kap njoftimin “Follow”, shtype si letër dhe flake jashtë kamere.

PROMPT / ENGLISH

Use the provided image as the exact first frame and visual reference. Preserve the man’s identity, face, hairstyle, clothing, hands, body position, table, background, lighting, and overall composition.

A photorealistic cinematic video. The man remains seated in the same position, facing the camera. A floating Instagram-style follow notification banner is visible exactly where it appears in the original image.

CRITICAL POSITION LOCK: At the start of the video, the notification banner must remain exactly in its original position, size, orientation, and placement in the frame. Do not move, resize, or reposition it by itself.

The camera stays completely static. No zoom, no pan, no cuts, no reframing.

The man naturally reaches one hand toward the notification banner. His hand movement must be realistic, with accurate anatomy, natural timing, and believable perspective.

As soon as his fingers touch the notification banner, it transforms seamlessly from a flat on-screen UI element into a thin physical sheet-like object made of lightweight paper, while preserving the same design, layout, text, profile photo, and button appearance.

He grabs the notification naturally and pulls it out of the screen space into real physical space. The object should now behave like soft paper, not rigid plastic or cardboard.

He then folds, crushes, and compresses the paper notification realistically using his hand, gradually crumpling it into a small paper ball. The crumpling motion must feel tactile and believable, with visible compression, creases, wrinkles, and deformation like real paper.

After turning it into a compact crumpled paper ball, he casually throws it out of frame. The throw must look natural and smooth. The paper ball should travel realistically through the air and exit the frame.

Once removed, the original clean background behind the banner is revealed and remains unchanged, with no trace of the notification left on screen.

Maintain full photorealism throughout: realistic hand interaction, believable paper physics, natural wrinkles and folding, accurate shadows, consistent lighting, and seamless visual continuity. The man stays calm and seated throughout the scene.

Style: ultra realistic, cinematic live-action, grounded motion, subtle visual effect, believable object interaction, seamless transformation from UI element into real crumplable paper.

3D OBJECT GRAB

Nxirre notification nga ekrani

Shndërro njoftimin në karton fizik, kape me dorë dhe hidhe.

PROMPT / ENGLISH

Use the provided image as the exact first frame and visual reference. Preserve the subject's identity, facial features, hairstyle, clothing, table, background, lighting, and overall composition.

A photorealistic cinematic video. The man remains seated in the same position. A floating Instagram-style notification banner is visible in front of him exactly where it appears in the original image.

CRITICAL POSITION LOCK: At the start of the video, the notification banner must remain exactly at its original position, size, orientation, and screen placement. Do not move, resize, or reposition it at the beginning.

The camera stays completely static. No zoom, no panning, no reframing, no cuts.

The man naturally reaches one hand toward the Instagram notification banner. His hand movement must be realistic, with correct anatomy, natural timing, and believable perspective.

When his fingers touch the notification banner, it transforms from a flat on-screen UI element into a physical lightweight cardboard cutout version of the same banner, while preserving the same design, text, proportions, blur effect, Instagram icon, username, timestamp, and preview thumbnail.

The transformation should feel seamless and realistic, as if he is pulling the notification out of the screen plane into real physical space.

He grips the cardboard notification naturally with his fingers, lifts it away from its original floating position, and holds it clearly in his hand. The object should behave like thin rigid cardboard: light, slightly stiff, physical, and believable.

After grabbing it, he casually throws the cardboard notification out of frame, off camera to the side. The throwing motion must look natural and smooth. The cardboard object should travel realistically through the air and exit the frame.

Once removed, the original clean background behind the notification is revealed and remains intact, with no trace of the banner left on screen.

Maintain photorealism throughout: realistic hand interaction, realistic object contact, believable depth, accurate shadows, natural motion, and seamless visual continuity. The subject stays seated and calm the entire time.

Style: ultra realistic, cinematic live-action, grounded motion, seamless object interaction, subtle and believable visual effect.
